

```
# Q.1) Write a Python program to count the even, odd numbers in a given
array of integers using
# Lambda.
# numbers = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
# even = list(filter(lambda x: (x % 2 == 0), numbers))
# odd = list(filter(lambda x: (x % 2 != 0), numbers))
# countEven = len(even)
# countOdd = len(odd)
#
# print(f"Original array: {numbers}")
# print(f"Even numbers count: {countEven}")
# print(f"Odd numbers count: {countOdd}")
```

```
C:\msys64\ucrt64\bin\python.exe "D:\DBDA CAD\Python\test\Day 6.py"
Original array: [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
Even numbers count: 5
Odd numbers count: 5
Enter number of rows:
```

```
# Q.2) Write a Python program to find palindromes in a given list of
strings using Lambda.
# s = "malayalam"
# i, j = 0, len(s) - 1
# is_palindrome = True
#
# while i < j:
#     if s[i] != s[j]:
#         is_palindrome = False
#         break
#     i += 1
#     j -= 1
#
# if is_palindrome:
#     print("Yes")
# else:
#     print("No")
```

```
C:\msys64\ucrt64\bin\python.exe "D:\DBDA CAD\Python\test\Day 6.py"
Yes
```

```
Process finished with exit code 0
```

```
# Q.3) Solve the following pattern using one loop only:  accept no. of rows
from user.
n = int(input("Enter number of rows: "))
# 1
# 121
# 12321
# 1234321

# s = ""
#
# for i in range(1, n + 1):
#     s = s + str(i)
```

```
# print(s + s[-2::-1])  
#  
# b = b"hello"  
#  
# result = list(b)  
#  
# print(result)
```

Enter number of rows: 4

1

121

12321

1234321

Q.4) Write a Python program to convert a byte string to a list of integers.

Sample Input:

"hello"

Sample Output:

[104, 101, 108, 108, 111]

```
# b = b"hello"
```

```
# result = list(b)
```

```
# print(result)
```
